

AI Product Discovery - Issue Log

Issue #1 – Duplicate Analysis Records

Priority: High

Observation: Duplicate records were created for the same analysis.

Root Cause: Application created a new analysis without checking for an existing active one.

Fix Applied: Reused the existing analysis_id instead of creating duplicate records using application logic.

Status: ☒ Fixed

Issue #2 – Continue Opens Empty Discovery Galaxy

Priority: High

Observation: Pending analyses opened an empty Discovery Galaxy with all values at 0%.

Root Cause: Analysis context and execution state were not restored before navigation.

Fix Applied: Restored the existing analysis state and resumed the pending analysis correctly.

Status: ☒ Fixed

Issue #3 – Dashboard Recommendation Cards

Priority: Medium

Observation: 'Avoid Implementation' and 'Ready for Implementation' displayed the same product.

Root Cause: Both cards referenced the same highest-confidence record.

Fix Applied: Ready card now displays the highest confidence score, while Avoid card displays the lowest confidence score.

Status: ☒ Fixed

Issue #4 – Website URL Validation

Priority: High

Observation: Any non-empty string was accepted as a URL.

Root Cause: Missing HTTP/HTTPS URL validation before submission.

Fix Applied: Added proper URL validation before starting analysis.

Status: ☒ Fixed

Issue #5 – URL Analysis Flow

Priority: High

Observation: Users were redirected to Discovery Galaxy even when URL analysis failed.

Root Cause: Navigation occurred before URL validation and content extraction.

Fix Applied: Validation and preprocessing now occur first. Errors remain on the New Analysis page and Discovery Galaxy opens only after successful preprocessing.

Status: ☒ Fixed

Issue #6 – Remove Redundant 'Add Notes' Option

Priority: Low

Observation: 'Add Notes' duplicated the functionality already available in the 'Your Idea' tab.

Root Cause: Overlapping input methods created unnecessary redundancy.

Fix Applied: Removed the 'Add Notes' option from the input section.

Status: ☒ Fixed

Issue #7 – Invalid JSON from AI Risk Assessment Workflow

Priority: High

Observation: JSON.parse() failed with 'Expected ',' or '}' after property value'.

Root Cause: The AI response contained an 'updated_at' field that caused malformed JSON in the n8n workflow.

Fix Applied: Removed the 'updated_at' field from the AI Gap Analysis node in the Risk Assessment n8n workflow.

Status: ☒ Fixed
